

# Oracle Developer

## When you want to import data from a csv file

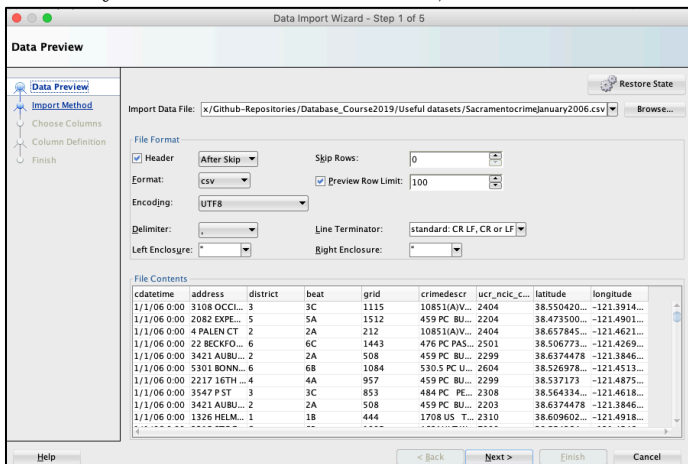

Importing raw dataset is very common in SQL Developer.

### STEPS:

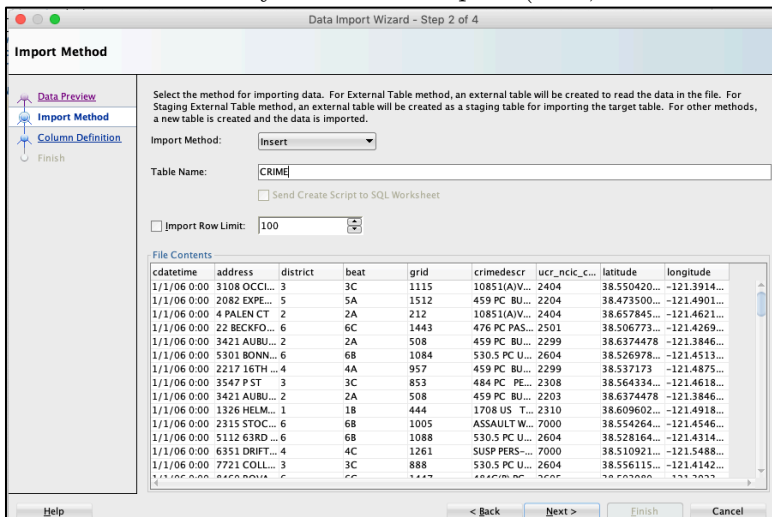

1. Right click on your database (here is 'Tables'). Then, choose 'Import data' option.

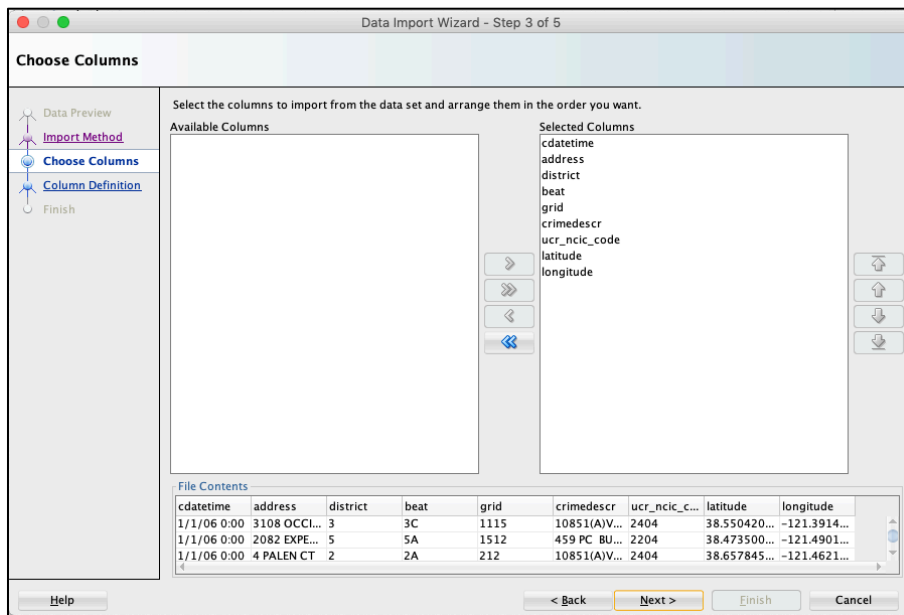

2. Choose your dataset with 'Browse', and click on the 'Next' button.

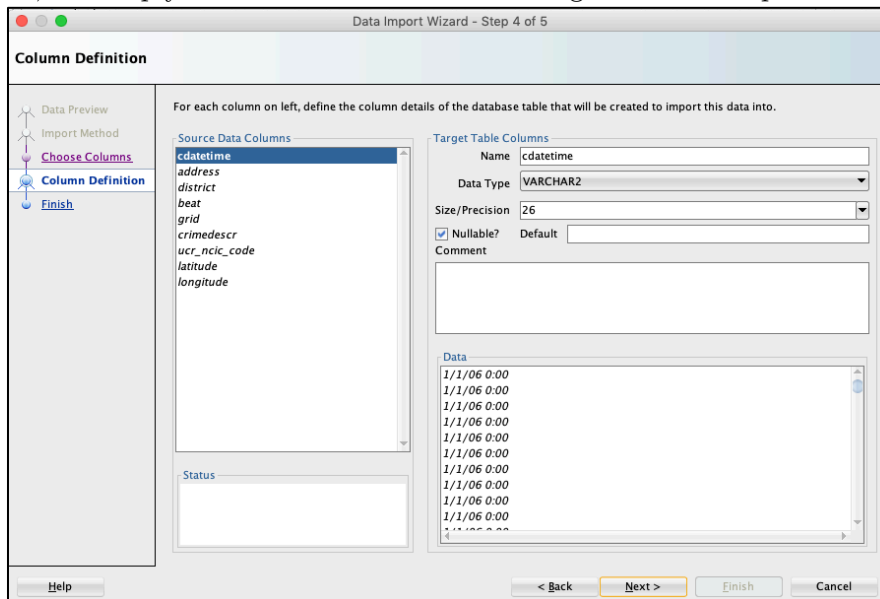

3. Pick up a name for your new table in your database (e.g. CRIME). You can also change the number of the lines you want to import (here, 100 rows have been chosen).

- You can choose the columns you want to enter in your new table. They are all selected by default.

- You can also change the data type for your columns, one by one. Here, we do not change them. So, we simply click on the 'Next' button to go the next step.

- By clicking on the 'Finish' button you will have the data in your new table.
